Summary

Associate DevOps Engineer at StackNet with strong hands-on experience in designing, deploying, and maintaining production-grade cloud infrastructure across AWS and GCP. Experienced in implementing scalable compute, storage, networking, security, and monitoring solutions using Infrastructure as Code with Terraform and containerization with Docker and Kubernetes.

Proven ability to automate end-to-end deployment workflows through CI/CD and manage reliable cloud-native environments using modern DevOps and observability practices, including Prometheus and Grafana. Brings practical production experience and a strong technical foundation in cloud infrastructure, automation, deployment, and reliability engineering.

Technical Skills

Cloud: AWS (EC2, VPC, IAM, ECR, EKS, Fargate, S3), Google Cloud Platform (Compute Engine, Cloud SQL, Cloud Storage), DigitalOcean

IaC & Automation: Terraform, Bash Scripting, GitOps (Argo CD)

Containers & Orchestration: Docker, Docker Compose, Kubernetes

CI/CD: GitHub Actions, Jenkins

Monitoring & Observability: Prometheus, Grafana

Linux & Networking: Ubuntu Server administration, Nginx (Reverse Proxy, SSL/TLS), DNS, Firewalls, Load Balancing, TCP/IP, DHCP

Databases: MySQL, PostgreSQL, MongoDB

Version Control: Git, GitHub

Experience

StackNet (Pvt) Ltd

Associate DevOps Engineer

Nov 2025 – Present

Colombo, Sri Lanka

- Designed and implemented end-to-end cloud deployment architectures for multiple production projects, covering infrastructure planning, provisioning, application deployment, networking, security, and production support.
- Provisioned and managed AWS cloud infrastructure using Terraform, including EC2, VPC, IAM, Security Groups, and supporting services, with a focus on scalable, secure, and cost-effective deployments.
- Built and maintained CI/CD pipelines using GitHub Actions and Jenkins, automating application builds, container image creation, testing, and production deployments to streamline release workflows.
- Containerized and deployed production applications using Docker and Docker Compose, with hands-on experience with Kubernetes for container orchestration and scalable workload management.
- Designed customer-specific deployment environments based on application requirements, infrastructure capacity, resource usage, and billing considerations, delivering tailored cloud solutions across multiple projects.
- Managed production environments including Ubuntu Linux servers, Nginx reverse proxies, DNS, SSL/TLS, networking, and firewall configurations to ensure secure and reliable application availability.
- Implemented Prometheus and Grafana monitoring and observability solutions to improve system visibility, resource monitoring, and production issue detection across deployed environments.
- Collaborated with development teams throughout the application lifecycle, from deployment architecture and infrastructure setup to production releases, troubleshooting, optimization, and ongoing operational support.

Key Projects

AgriSL — AI-Powered Farming Platform on AWS

2026

- Developed a bilingual AI farming platform with React, Node.js, and MySQL, including a CNN-based crop disease detection system built with TensorFlow for image-based disease classification.
- Deployed the ML inference pipeline using a serverless architecture with AWS Lambda and Amazon S3, enabling scalable image uploads and on-demand crop disease predictions.
- Containerized application components with Docker and implemented automated CI/CD pipelines using GitHub Actions for reliable application deployments.

Cloud-Native Web Application Platform — AWS

2026

- Provisioned AWS infrastructure (EC2, VPC, IAM, Security Groups) with Terraform; containerized a React/Node.js/MongoDB stack with Docker and automated deployment via GitHub Actions.
- Set up Prometheus/Grafana monitoring, Cloudflare DNS, and Nginx reverse proxy with SSL/TLS.

GitOps Kubernetes Deployment with Argo CD

2026

- Built GitOps workflows with Argo CD for automated Kubernetes deployments from GitHub, with self-healing and drift detection.
- Deployed Prometheus/Grafana for cluster-wide observability.

Virtual Network with Automated DHCP IP Assignment

2025

- Designed a virtualized network environment using multiple VMs, implementing a DHCP server to automatically assign IP addresses and network configuration to client machines.
- Configured virtual networking, IP address ranges, subnetting, DHCP scopes, gateways, and DNS settings to enable automated network connectivity between VMs.

Certifications

Introduction to Kubernetes (LFS158) — Linux Foundation

Introduction to DevOps and SRE (LFS162) — Linux Foundation

Introduction to DevSecOps for Managers (LFS180) — Linux Foundation

Getting Started with DevOps on AWS

Amazon EKS Primer — AWS

AWS Fargate Overview

Introduction to Containers — AWS

Introduction to Cloud 101 — AWS

Linux: Network Configuration — LinkedIn Learning

Introduction to Cybersecurity — Cisco

Education

University of Colombo School of Computing (UCSC)

B.Sc. Computer Science (Undergraduate)

2023 – 2026

Colombo, Sri Lanka

Saralankara National College

G.C.E. A/L – Physical Science (1A, 2B)

2018 – 2021

Galle, Sri Lanka
